

Package ‘jmvcore’

November 16, 2021

Type Package

Title Dependencies for the 'jamovi' Framework

Version 2.2

Date 2021-11-15

Author Jonathon Love

Maintainer Jonathon Love <jon@thon.cc>

Description A framework for creating rich interactive analyses for the jamovi platform (see <<https://www.jamovi.org>> for more information).

URL <https://www.jamovi.org>

BugReports <https://github.com/jamovi/jmvcore/issues>

License GPL (>= 2)

ByteCompile yes

Depends R (>= 3.2)

Imports R6 (>= 1.0.1), rlang (>= 0.3.0.1), jsonlite, base64enc, stringi

Suggests testthat (>= 1.0.2), RProtoBuf, knitr, ggplot2, RColorBrewer, ragg

RoxygenNote 6.1.1

NeedsCompilation no

Repository CRAN

Date/Publication 2021-11-15 23:10:02 UTC

Index	21
--------------	-----------

Analysis	<i>the jmvcore Object classes</i>
----------	-----------------------------------

Description

the jmvcore Object classes

Usage

Analysis

Array

Column

Group

Html

Image

Output

Preformatted

State

Table

Format

An object of class R6ClassGenerator of length 25.

canBeNumeric	<i>Determines whether an object is or can be converted to numeric</i>
--------------	---

Description

Determines whether an object is or can be converted to numeric

Usage

canBeNumeric(object)

Arguments

object the object

Cell.BEGIN_GROUP	<i>Constants to specify formatting of Table cells</i>
------------------	---

Description

Cell.BEGIN_GROUP adds spacing above a cell

Usage

Cell.BEGIN_GROUP

Cell.END_GROUP

Cell.BEGIN_END_GROUP

Cell.NEGATIVE

Cell.INDENTED

Format

An object of class `numeric` of length 1.

Details

`Cell.END_GROUP` add spacing below a cell

`Cell.BEGIN_END_GROUP` add spacing above and below a cell

`Cell.NEGATIVE` specifies that the cells contents is negative

Examples

```
## Not run:  
  
table$addFormat(rowNo=1, col=1, Cell.BEGIN_END_GROUP)  
  
## End(Not run)
```

colorPalette

A function that creates a color palette

Description

A function that creates a color palette

Usage

```
colorPalette(n = 5, pal = "jmv", type = "fill")
```

Arguments

n	Number of colors needed
pal	Color palette name
type	'fill' or 'color'

Value

a vector of hex color codes

composeFormula	<i>Compose a formula string</i>
----------------	---------------------------------

Description

Compose a formula string

Usage

```
composeFormula(lht, rht)
```

Arguments

lht	list of character vectors making up the left
rht	list of character vectors making up the right

Value

a string representation of the formula

Examples

```
composeFormula(list('a', 'b', c('a', 'b')))  
# ~a+b+a:b  
  
composeFormula('f', list('a', 'b', c('a', 'b')))  
# "f~a+b+a:b"  
  
composeFormula('with spaces', list('a', 'b', c('a', 'b')))  
'`with spaces`~a+b+a:b'
```

composeTerm	<i>Compose and decompose interaction terms to and from their components</i>
-------------	---

Description

Compose and decompose interaction terms to and from their components

Usage

```
composeTerm(components)

composeTerms(listOfComponents)

decomposeTerm(term)

decomposeTerms(terms)
```

Arguments

components	a character vectors of components
listOfComponents	a list of character vectors of components
term	a string with components separated with colons
terms	a character vector of components separated with colons

Examples

```
composeTerm(c('a', 'b', 'c'))
# 'a:b:c'

composeTerm(c('a', 'b', 'with space'))
# 'a:b:`with space`'

decomposeTerm('a:b:c')
# c('a', 'b', 'c')

decomposeTerm('a:b:`with space`')
# c('a', 'b', 'with space')
```

constructFormula	<i>Construct a formula string</i>
------------------	-----------------------------------

Description

Construct a formula string

Usage

```
constructFormula(dep = NULL, terms)
```

Arguments

dep	the name of the dependent variable
terms	list of character vectors making up the terms

Value

a string representation of the formula

Examples

```
constructFormula(terms=list('a', 'b', c('a', 'b')))  
# a+b+a:b
```

```
constructFormula('f', list('a', 'b', c('a', 'b')))  
# "f~a+b+a:b"
```

```
constructFormula('with spaces', list('a', 'b', c('a', 'b')))  
'\`with spaces`~a+b+a:b'
```

create

Create an analysis

Description

Used internally by jamovi

Usage

```
create(ns, name, optionsPB, datasetId, analysisId, revision)
```

Arguments

ns	package name
name	analysis name
optionsPB	options protobuf object
datasetId	dataset id
analysisId	analysis id
revision	revision

createError	<i>Create and throw errors</i>
-------------	--------------------------------

Description

These functions are convenience functions for creating and throwing errors.

Usage

```
createError(formats, code = NULL, ...)
```

```
reject(formats, code = NULL, ...)
```

Arguments

formats	a format string which is passed to format
code	an error code
...	additional arguments passed to format

decomposeFormula	<i>Decompose a formula</i>
------------------	----------------------------

Description

Decompose a formula

Usage

```
decomposeFormula(formula)
```

Arguments

formula	the formula to decompose
---------	--------------------------

Value

a list of lists of the formulas components

extractErrorMessage	<i>Extracts the error message from an error object</i>
---------------------	--

Description

Extracts the error message from an error object

Usage

```
extractErrorMessage(error)
```

Arguments

error	an error object
-------	-----------------

format	<i>Format a string with arguments</i>
--------	---------------------------------------

Description

Substitutes the arguments into the argument str. See the examples below.

Usage

```
format(str, ..., context = "normal")
```

Arguments

str	the format string
...	the arguments to substitute into the string
context	'normal' or 'R'

Value

the resultant string

Examples

```
jmvcore::format('the {} was delish', 'fish')  
# 'the fish was delish'  
  
jmvcore::format('the {} was more delish than the {}', 'fish', 'cow')  
# 'the fish was more delish than the cow'
```

```

jmvcore::format('the {1} was more delish than the {0}', 'fish', 'cow')
# 'the cow was more delish than the fish'

jmvcore::format('the {what} and the {which}', which='fish', what='cow')
# 'the cow and the fish'

jmvcore::format('that is simply not {}', TRUE)
# 'that is simply not true'

jmvcore::format('that is simply not {}', TRUE, context='R')
# 'that is simply not TRUE'

```

isError	<i>Determine if an object is an error</i>
---------	---

Description

Determine if an object is an error

Usage

```
isError(object)
```

Arguments

object the object to test

Value

TRUE if the object is an error

marshalData	<i>Marshal the data from an environment into a data frame</i>
-------------	---

Description

Marshal the data from an environment into a data frame

Usage

```
marshalData(env, ...)
```

Arguments

env the environment to marshal from
 ... the variables to marshal

Value

a data frame

marshalFormula *Marshal a formula into options*

Description

Marshal a formula into options

Usage

```
marshalFormula(formula, data, from = "rhs", type = "vars",
  permitted = c("numeric", "factor"), subset = ":", required = FALSE)
```

Arguments

formula the formula
 data a data frame to marshal the data from
 from `rhs` or `lhs`, which side of the formula should be marshalled
 type `vars` or `terms`, the type of the option be marshalled to
 permitted the types of data the option permits
 subset a subset of the formula to marshal
 required whether this marshall is required or not

matchSet *Determines the index where an item appears*

Description

Determines the index where an item appears

Usage

```
matchSet(x, table)
```

Arguments

x the item to find
 table the object to search

Value

the index of where the item appears, or -1 if it isn't present

naOmit	<i>remove missing values from a data frame listwise</i>
--------	---

Description

removes all rows from the data frame which contain missing values (NA)

Usage

```
naOmit(object)
```

Arguments

object the object to remove missing values from

Details

this function is equivalent to `na.omit` from the stats package, however it preserves attributes on columns in data frames

Options	<i>The jmv Options classes</i>
---------	--------------------------------

Description

The jmv Options classes

Usage

```
Options  

OptionBool  

OptionList  

OptionNMXList
```

OptionVariables
OptionTerm
OptionVariable
OptionOutput
OptionTerms
OptionInteger
OptionNumber
OptionString
OptionLevel
OptionGroup
OptionPair
OptionSort
OptionArray
OptionPairs

Format

An object of class R6ClassGenerator of length 25.

resolveQuo	<i>Evaluates a quosure This is intended for use by classes overriding Analysis</i>
------------	--

Description

Evaluates a quosure This is intended for use by classes overriding Analysis

Usage

```
resolveQuo(quo)
```

Arguments

quo the quosure to evaluate

Value

the value of the quosure

select	<i>Create a new data frame with only the selected columns</i>
--------	---

Description

Shorthand equivalent to `subset(df, select=columnNames)`, however it additionally preserves attributes on the columns

Usage

```
select(df, columnNames)
```

Arguments

df	the data frame
columnNames	the names of the columns to make up the new data frame

Value

the new data frame

sourcify	<i>Converts basic R object into their source representation</i>
----------	---

Description

Converts basic R object into their source representation

Usage

```
sourcify(object, indent = "")
```

Arguments

object	the object to convert to source
indent	the level of indentation to use

Value

a string of the equivalent source code

Examples

```
sourcify(NULL)

# 'NULL'

sourcify(c(1,2,3))

# 'c(1,2,3)''

l <- list(a=7)
l[['b']] <- 3
l[['c']] <- list(d=3, e=4)
sourcify(l)

# 'list(
#   a=7,
#   b=3,
#   c=list(
#     d=3,
#     e=4))'
```

startsWith*Test whether strings start or end with a particular string*

Description

Same as `base::startsWith()` and `base::endsWith()` except available for `R < 3.3`

Usage

```
startsWith(x, prefix)
```

```
endsWith(x, suffix)
```

Arguments

<code>x</code>	a string to test
<code>prefix</code>	a string to test the presence of
<code>suffix</code>	a string to test the presence of

stringifyTerm	<i>Converts a term into a string</i>
---------------	--------------------------------------

Description

Converts a term (a vector of components) into a string for display purposes

Usage

```
stringifyTerm(components, sep = getOption("jmvTermSep", ":"),  
              raise = FALSE)
```

Arguments

components	a character vector of components
sep	a separator to go between the components
raise	whether duplicates should be raised to powers

Value

the components joined together into a string for display

Examples

```
stringifyTerm(c('a', 'b', 'c'))  
  
# "a:b:c"  
  
stringifyTerm(c('a', 'b', 'c'), sep=' * ')  
  
# "a * b * c"  
  
options('jmvTermSep', ' * ')  
stringifyTerm(c('a', 'b', 'c'))  
  
# "a * b * c"  
  
#' stringifyTerm(c('\`quoted\`', 'b', 'c'))  
  
# "quoted * b * c"
```

theme_default	<i>Creates the default jmv ggplot2 theme</i>
---------------	--

Description

Creates the default jmv ggplot2 theme

Usage

```
theme_default(base_size = 16, scale = "none", palette = "jmv")
```

Arguments

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

Value

the default jmv ggplot2 theme

theme_hadley	<i>Creates the hadley jmv ggplot2 theme</i>
--------------	---

Description

Creates the hadley jmv ggplot2 theme

Usage

```
theme_hadley(base_size = 16, scale = "none", palette = "jmv")
```

Arguments

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

Value

the hadley jmv ggplot2 theme

theme_min	<i>Creates the minimal jmv ggplot2 theme</i>
-----------	--

Description

Creates the minimal jmv ggplot2 theme

Usage

```
theme_min(base_size = 16, scale = "none", palette = "jmv")
```

Arguments

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

Value

the minimal jmv ggplot2 theme

theme_spss	<i>Creates the spss jmv ggplot2 theme</i>
------------	---

Description

Creates the spss jmv ggplot2 theme

Usage

```
theme_spss(base_size = 16, scale = "none", palette = "jmv")
```

Arguments

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

Value

the spss jmv ggplot2 theme

toB64	<i>Convert names to and from Base64 encoding</i>
-------	--

Description

Note: uses the . and _ characters rather than + and / allowing these to be used as variable names

Usage

```
toB64(names)
```

```
fromB64(names)
```

Arguments

names	the names to be converted base64
-------	----------------------------------

toNumeric	<i>Converts a vector of values to numeric</i>
-----------	---

Description

Similar to [as.numeric](#), however if the object has a values attribute attached, these are used as the numeric values

Usage

```
toNumeric(object)
```

Arguments

object	the vector to convert
--------	-----------------------

tryNaN	<i>try an expression, and return NaN on failure</i>
--------	---

Description

if the expression fails, NaN is returned silently

Usage

```
tryNaN(expr)
```

Arguments

expr an expression to evaluate

Value

the result, or NaN on failure
